STATIONS WITH HIGHEST MORBIDITY RATES.	71

WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. Troops in transit and certain small detachments are not required to submit reports; for this and other reasons, the total strength of the reporting units as shown herein has been consistently about four percent below the actual strength of the Army in the Continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

Admissions are reported only for cases hospitalized or confined to quarters and excused from duty for 24 hours or longer, except for certain cases carded for record only (chiefly venereal disease cases treated on a duty status, and deaths which occurred before admission to hospital or quarters). Admissions designated as "injury" comprise all traumas other than battle casualties (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, and reactions to medications as well as various types of wounds not due to enemy action). Under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties. All cases other than those of injury or battle casualty are classified as "disease."

Admission rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The average proportion of the daily strength of the command which is confined to hospital or quarters (mean number of non-effectives per thousand strength) is given in the summary table for the total United States and for each of the Service Commands. This ratio may not be significant when the strength of a Command is changing markedly or when a Command has a relatively large number of General Hospitals.

The number of enlisted men discharged during the week on Certificates of Disability for Discharge (CDD) are shown for individual stations. These data should be distinguished from the figures for "honorable discharges for physical and mental disqualification" published in the ASF Monthly Progress Report; the latter include discharges for inaptness in addition to CDD's and are assembled on a somewhat different basis (e.g., the April data represent April discharges processed by the AGO during April and May plus discharges prior to April which were processed in May).

MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 25 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of total beds authorized and total beds occupied.

Unless otherwise specified, beds authorized as shown in this report are defined in par. 36h of AR 40-1080, C 2. Total beds include expansion beds in addition to normal beds. Beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in the tabulations for individual stations.

Regional Hospitals are distinguished from Station Hospitals by the letters (RH) appearing after the name of the station.

In the case of General Hospitals there are shown, in addition, the number of Army patients admitted, the number disposed of during the week (by return to duty, transfer, death, CDD, or otherwise), and the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, subdivided by disease, injury, and battle casualty patients. The patient days of treatment are presented separately for hospital and for convalescent facilities. The bed capacity and beds occupied in convalescent facilities are also indicated.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station have not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 21 JULY 1944

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

All Causes: Disease and Injury:

During the week ending 21 July 1944 the admission rate from all causes was reported at 557 per thousand, substantially the same as for the previous week but about 5 percent above the minimum rate for the year, recorded during the last week of June and the first week of July. The admission rate for the current week for all causes, for all diseases, and for all injuries is in each case approximately 25 percent lower than for the corresponding week of 1943.

Morbidity from disease during the current week was at a rate of 483 per thousand which was practically the same as for the previous week. The current week's admission rate from disease is 18 percent below the lowest rate experienced during 1943.

Morbidity from injury decreased somewhat from the relatively high rate recorded in the previous week to a rate of 74 per thousand for the current week.

Respiratory Causes:

Morbidity from colds, influenza, etc. decreased slightly to a rate of 66 per year per thousand to continue the steady downward trend which prevailed during the previous 21 weeks. Current morbidity from these causes is about 30 percent under that for the corresponding week of 1943; in fact since the first week of June 1944 the admission rate has been under the lowest rate experienced in 1943.

The admission rate from pneumonia decreased slightly to a rate of 6 per thousand, which is the lowest level attained so far this year and well below the min-

imum rate recorded during 1943 (8 per thousand during September).

Common Communicable Diseases:

Morbidity from venereal disease (excluding cases contracted prior to entry into active service) increased slightly to a rate of 36 per thousand, the highest reported since early in 1942. Current morbidity from these causes is about 25 percent higher than during the corresponding week of 1943.

The admission rate for diarrhea and dysentery decreased fractionally to 13 per thousand and was only about one-half as high as the rate for the corresponding week of 1943.

The numbers of new cases of measles, mumps, and scarlet fever all decreased sharply during the current week following the expected seasonal trend. The numbers of new cases of measles and scarlet fever for the current week were both lower than the minimum figures registered during 1943.

The number of new cases of meningitis decreased to the same relatively low level reported two weeks ago. The number of new cases of rheumatic fever increased somewhat although it continued low in relation to the experience during most of 1944. The number of new cases of poliomyelitis reported for the current week was 4 as contrasted with 3 for the previous week.

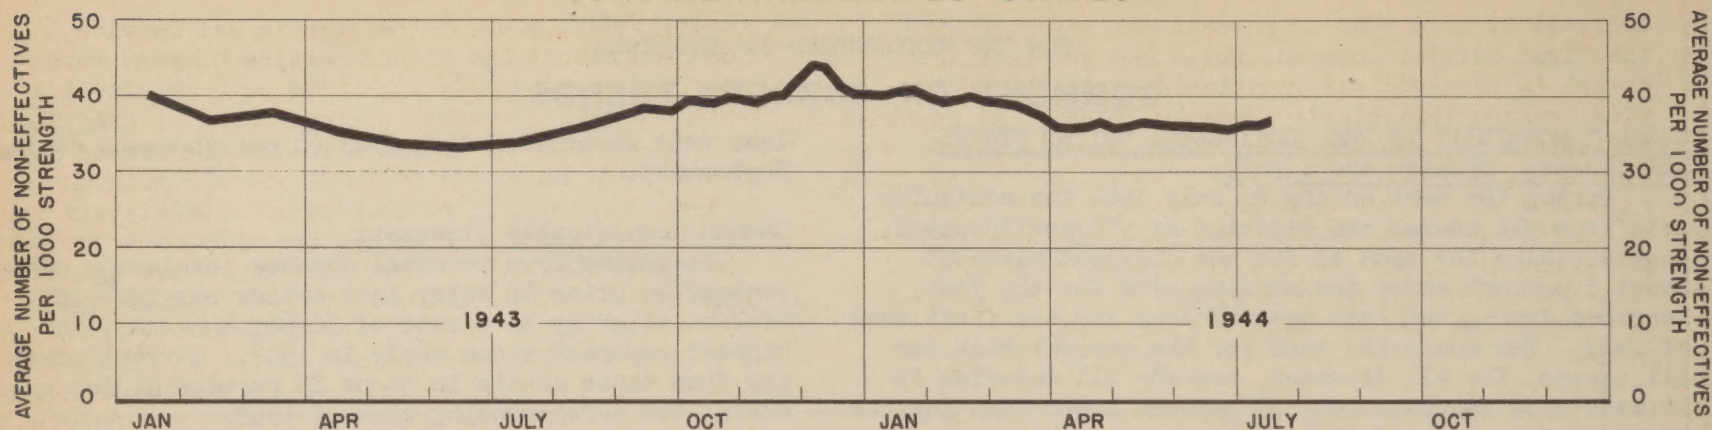

VARIATIONS IN MORBIDITY BY SERVICE COMMAND

All Causes: Disease and Injury:

The admission rate from disease showed only minor fluctuations in most Service Commands. However, a

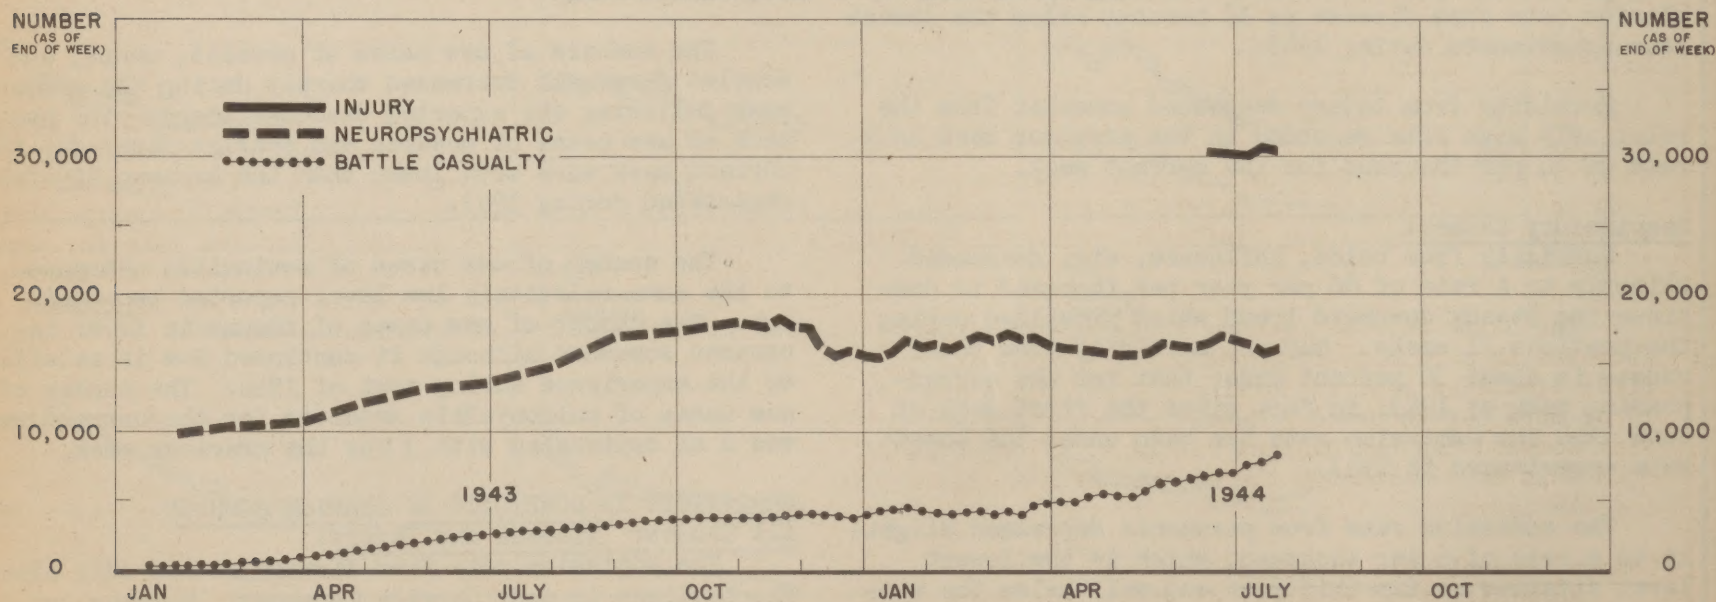

NON-EFFECTIVE RATE

CONTINENTAL UNITED STATES

PATIENTS REMAINING UNDER TREATMENT

CONTINENTAL UNITED STATES

COMMENT ON CURRENT TRENDS (CONT'D)

decrease of more than 10 percent was reported by the First Service Command, while the greatest increase (9 percent) was registered by the Ninth Service Command (principally because of sharply increased admissions at Camp Stoneman, Calif.). The Second Service Command continued to report the highest admission rate from all causes (635 per thousand) and from disease (558 per thousand). The Sixth Service Command again had the lowest morbidity from disease (446 per thousand) although the First, Third, Fifth, Seventh, and Eighth Service Commands had only slightly higher rates.

Sharp decreases in the admission rate from injury were reported by the First, Third, Fifth, Seventh, and Ninth Service Commands, but the Second and Fourth Service Commands registered significant increases. The highest morbidity rates from injury were reported by the Fourth and Eighth Service Commands (82 per thousand).

Respiratory Causes:

In general, most Service Commands had about the same morbidity from colds, influenza, etc. during the current week as during the previous one. However, in the First and Third Service Commands sizeable decreases occurred. Only the Second Service Command reported an admission rate from colds, influenza, etc. in excess of 75 per thousand.

The Sixth Service Command registered a sizeable decrease in morbidity from pneumonia so that for the first time this year no Service Command had a rate of 10 or more per thousand. Nevertheless, the Sixth Service Command had the highest morbidity of any Command from this cause although the excess was not significantly large.

Common Communicable Diseases:

Morbidity from venereal diseases, excluding EPTS

cases, remained about the same in all Service Commands except the Second Service Command which reported an unusually high rate as a result of a relatively large number of admissions at Camp Shanks, N.Y. and Tilton G. H. As a result the Second Service Command displaced the Fifth as the one with the highest morbidity from this cause. Relatively large numbers of task force troops not under the jurisdiction of the Second Service Command are in large part responsible for the high morbidity from this cause.

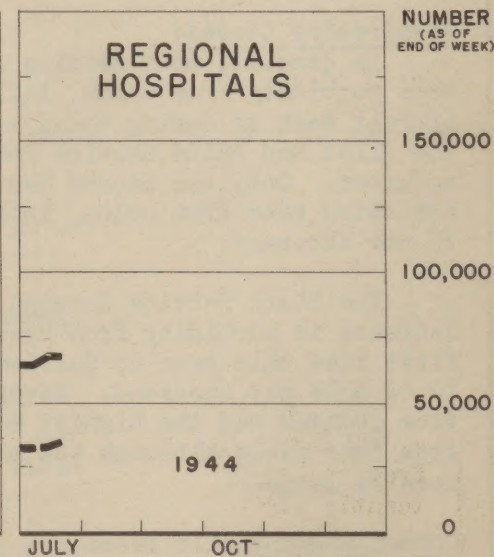

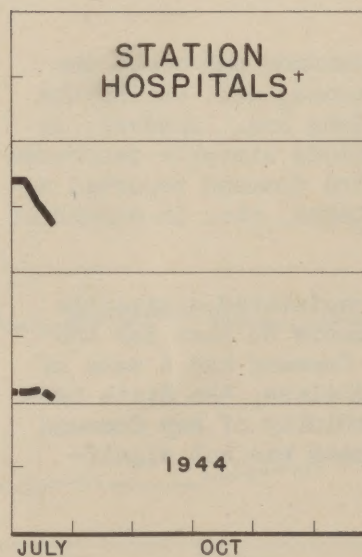

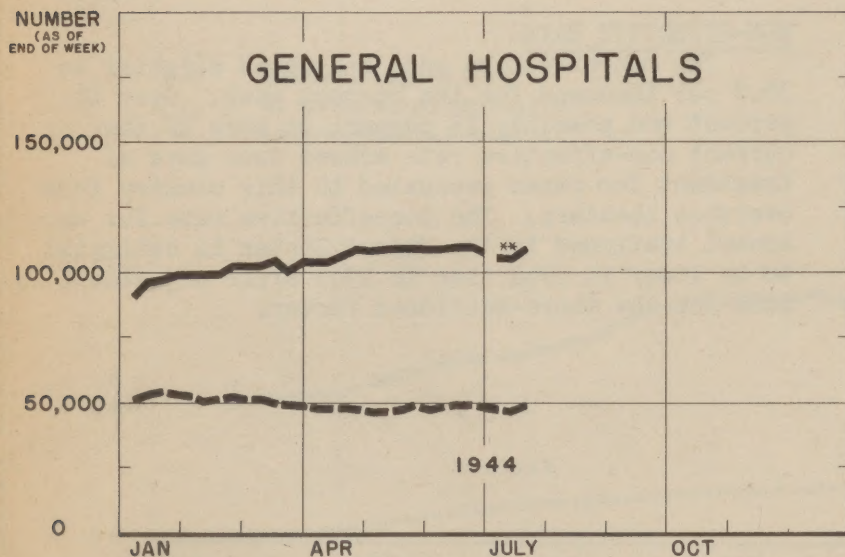

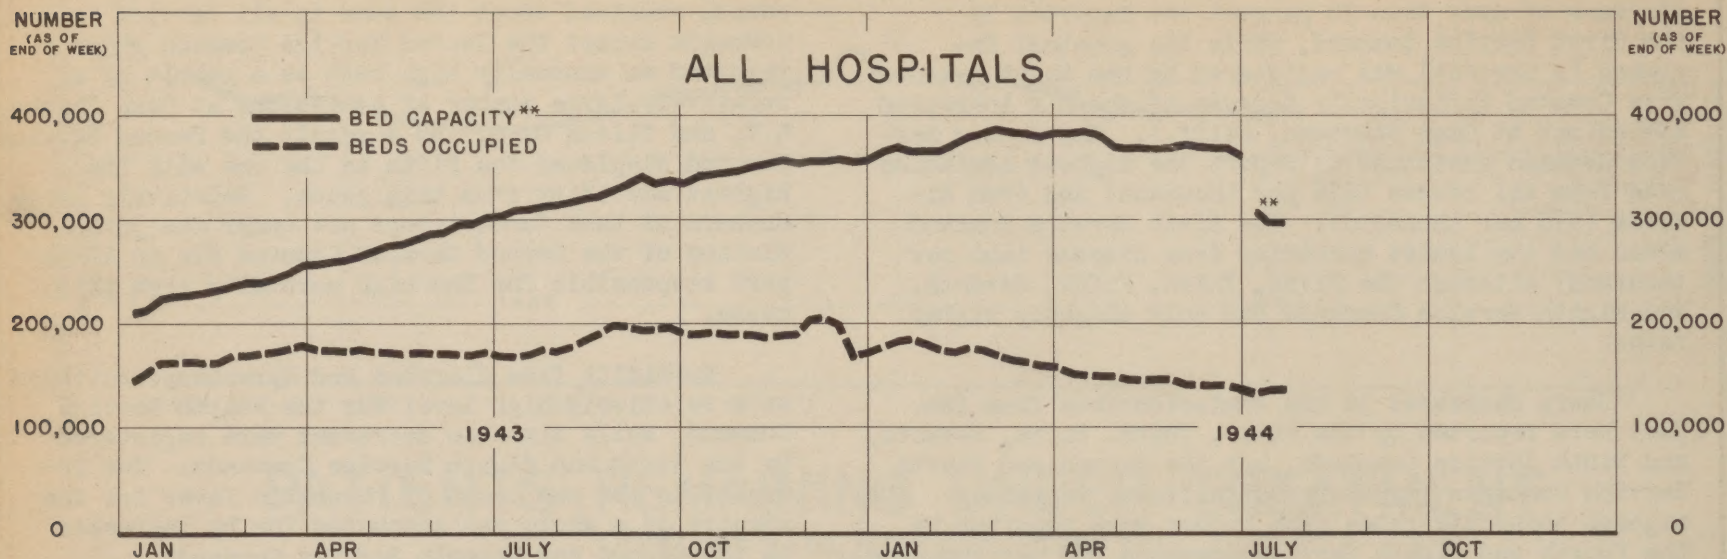

Morbidity from diarrhea and dysentery continued at a relatively high level for the Fourth Service Command, while sizeable decreases were registered by the Sixth and Eighth Service Commands. The increase in the new cases of rheumatic fever for the country as a whole was accounted for by increases in the Second and Seventh Service Commands.

NON-EFFECTIVE RATE:

The non-effective rate increased slightly to 36.8 per thousand for the current week. Over 10 percent and possibly 15 percent or more of the current non-effective rate arises from days of treatment for cases evacuated to this country from overseas theaters. The non-effective rate for personnel stationed in the United States is estimated to be lower in 1944 than in 1943 after adjustment is made for the above-mentioned factor.

HOSPITALIZATION DATA*

CONTINENTAL UNITED STATES

*EXCLUSIVE OF BEDS REPORTED IN DISPENSARIES, CONVALESCENT FACILITIES, VENEREAL DISEASE FACILITIES, AND COLLEGE TRAINING UNITS.

**AFTER JUNE 1944 DATA ARE FOR AUTHORIZED BEDS

† ALSO INCLUDES BEDS IN NON-FIXED HOSPITALS AT MANEUVER AREAS.

COMMENT ON CURRENT TRENDS (CONT'D)

PATIENTS REMAINING UNDER TREATMENT:

The total number of Army patients remaining in hospital at the end of the week was equivalent to a rate of 36.4 per thousand strength. The number of neuropsychiatric cases remaining as of 21 July 1944 was reported at 15,996 or about 200 more than the previous week.

The number of non-battle injury patients remaining under treatment in hospital and quarters as of 21 July 1944 totaled about 30,500 while the number of battle casualty patients remaining increased slightly to 8,368. All but 162 of the latter were in General Hospitals.

CERTIFICATES OF DISABILITY FOR DISCHARGE:

During the week ending 21 July 1944 the total number of enlisted men discharged by CDD was 2,893 or about 100 less than the previous week. Almost one-half of these discharges were reported by General Hospitals.

CURRENT HOSPITAL CONDITIONS:

In this report hospitalization data are presented in terms of authorized beds rather than in terms of bed capacity. (For definitions of beds authorized see paragraph 36h, AR 40-1080, C 2.) In a few instances where stations have not reported the number of authorized beds, the figures presented in this report are those for the reported total bed capacity. It should be noted that the total authorized beds may equal but cannot exceed the total bed capacity, and as a rule the former will be lower than the latter.

The total authorized beds as of 21 July 1944 numbered about 296,000, or about 2,000 less than at the end of the previous week. The total number of beds occupied was 136,000 (or 46 percent of the total beds authorized) which was about 1,000 more than at the end of the previous

week. Included in the total authorized beds were 278 T/O hospital beds and tentage, none of which were occupied.

The total authorized beds in General Hospitals numbered 109,000 or about 4,000 more than at the end of the previous week; this increase was the result of the opening of McGuire G.H., the merger of Fort Devens Regional Hospital with Lovell G.H., and the merger of Fort Bliss Regional Hospital with Wm. Beaumont G.H. The total beds occupied in General Hospitals were about 49,000 (or about 45 percent of the authorized beds) which was about 2,000 more than at the end of the previous week because of the changes mentioned previously.

Station hospitals (as distinct from Regional Hospitals) reported 119,000 total authorized beds, while the Regional Hospitals reported about 68,000 beds. The number of beds occupied at station hospitals was about 52,000 or 44 percent of the total authorized beds. The beds occupied at Regional Hospitals numbered 35,000 or 51 percent of the total authorized beds.

As of 21 July 1944 the bed capacity of convalescent facilities in General Hospitals was 17,648 which was an increase of about 2,000 as compared with the previous week principally due to the reporting for the first time of convalescent facilities at Lovell G.H., Nichols G.H., and Wm. Beaumont G.H. The total beds occupied in such convalescent facilities was 5,280 which was 30 percent of the total bed capacity.

HEALTH REPORTS BRANCH

SUPPLEMENTARY HEALTH REPORT

FOR THE FIVE WEEK PERIOD ENDING 30 JUNE 1944

COMMENT ON RECENT DEVELOPMENTS

NATURE OF THE DATA:

The data of this Supplementary Report, like those of the Weekly Health Reports, have been taken from Forms 86ab rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. However, unlike the Weekly Health Reports which are compiled on the basis of the figures as received, so as to place the information in circulation at the earliest possible time, the figures here presented for the five week period ending 30 June 1944 include the great majority of the corrected reports as well as reports received too late to be incorporated in the Weekly Health Report.

This Supplementary Report covers morbidity and mortality data for all individual stations with a strength of 1000 or over and gives details for admissions from venereal disease and for neuropsychiatric cases.

Charts showing morbidity trends from all causes, from all diseases combined, from injury, and from colds, influenza, etc. are presented on page 35. Similar charts for specified diseases appear on pages 37, 39, and 41. A chart showing mortality trends is presented on page 43. A summary for the month of the number of admissions and corresponding morbidity rates and of the number of deaths and corresponding mortality rates for the United States as a whole and for the Service Commands is given on page 46, while on pages 44 and 45 there is a cumulative summary for the year to date for 1943 and for 1944. The most pertinent morbidity data for individual stations are presented on pages 47 to 72. On pages 73 and 74 the

six stations with the highest rates of admission during the month are shown for each of the morbidity categories considered.

In reading the detailed tables, it should be borne in mind that morbidity (or mortality) rates based on small numbers of cases are not reliable. For this reason the symbol "?" has been placed after rates computed on the basis of 5 or fewer cases. Attention is directed to the definitions of admissions and admission rates and the discussion of the proportion of total Army strength included in the stations covered by this Report as given on Page 2. Hereafter, the term "month" will be used to denote the four or five week period based on the number of Fridays in the calendar month.

MORBIDITY FROM ALL CAUSES: DISEASE AND INJURY

Morbidity from all causes and from disease was lower in June than in May, thus continuing the downward trend manifest since January. Admission rates from all causes and from disease decreased about 10 percent since May. The admission rate from disease has declined about 50 percent from the peak rate recorded for December 1943, almost entirely due to lower morbidity from respiratory causes. The annual admission rate from all causes for June was at the lowest point for this war, being reported at 552 per year per thousand strength or almost 25 percent below that for June 1943.

The admission rate for injury increased by about 7 percent to a rate of 73 per thousand, the highest recorded since November 1943. Nonetheless the current

RESTRICTED

COMMENTS ON RECENT DEVELOPMENTS (CONT'D)

level of morbidity from this cause is about 20 percent under that for the corresponding month of 1943.

The admission rate from disease for the first 6 months of 1944 was 619 per thousand or almost 25 percent lower than the corresponding rate for 1943. The admission rate from injury for the first half of 1944 was 69 per thousand or about 15 percent lower than for the same period of 1943.

Lower morbidity from disease during June as compared with May was reported by every Service Command. The largest decreases occurred in the Third, Sixth, and Seventh Service Commands and the Military District of Washington, all of which showed declines of over 100 per thousand in the admission rate, largely because of corresponding decreases in morbidity from colds, influenza, etc.

The Military District of Washington again reported the highest admission rates from all causes and from disease (more than 10 percent higher than for the country as a whole); the Second Service Command reported the next highest rates, only slightly below those for the Military District of Washington. The lowest admission rates from all causes and from disease were registered in the Sixth Service Command (about 5 percent under those for the United States as a whole). It is noteworthy that the First, Third, Fourth, Fifth, Seventh, and Ninth Service Commands all experienced morbidity from disease within 2 percent of the rate for the total United States.

RESPIRATORY DISEASES:

The admission rate from colds, influenza, etc. decreased from 121 per thousand in May to 77 per thousand in June, a decline of over 35 percent. The rate for June was more than 40 percent lower than

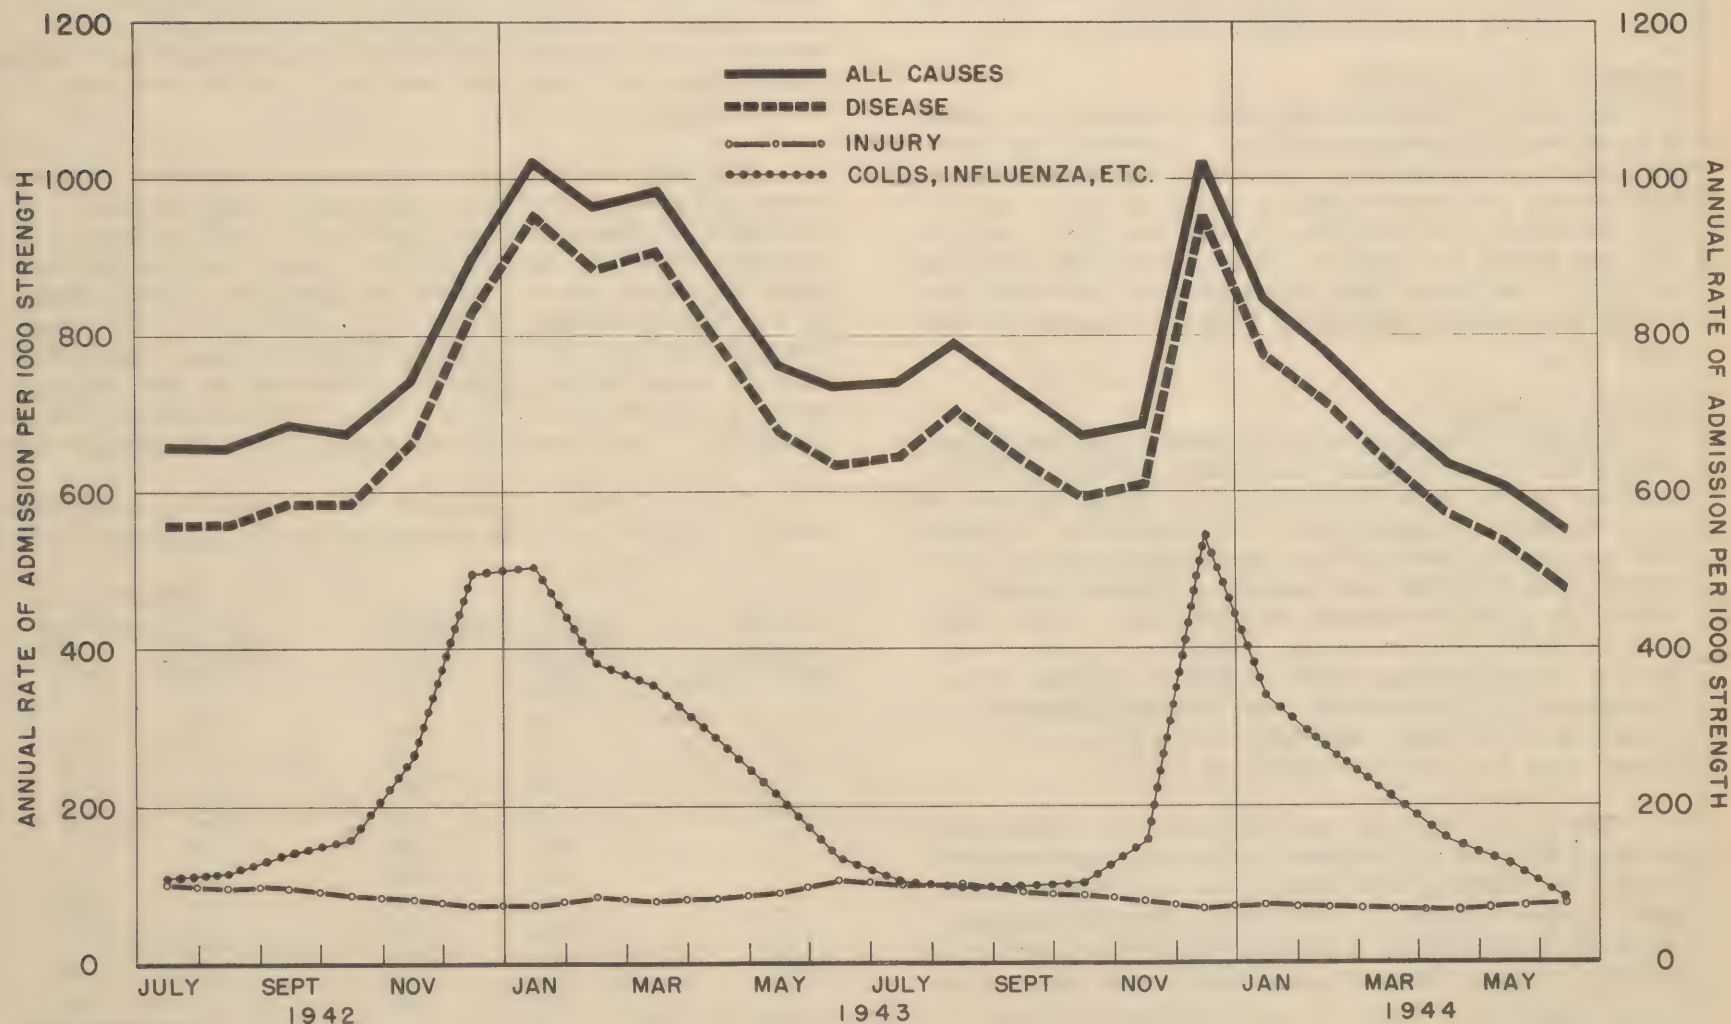

that for the corresponding month of 1943; it was in fact the lowest rate recorded during this war, being about 20 percent below the previous record low (August 1943). In contrast with the peak morbidity for colds, influenza, etc. reached in December 1943, current morbidity is 85 percent lower. Morbidity from these causes during the first six months of 1944 was almost 40 percent lower than during 1943.

For the third consecutive month every Service Command reported lower morbidity from colds, influenza, etc. The largest decreases were registered in the Sixth and Seventh Service Commands which had previously reported by far the highest admission rates of any Service Commands. Nonetheless, the Seventh Service Command along with the Second, reported the highest morbidity from these causes (about 95 per year per thousand); however, this level of morbidity was only about 20 percent higher than that for the country as a whole, whereas during May variations in morbidity from these causes were much wider as is evidenced by the Seventh Service Command reporting an admission rate 40 percent above the average for the U.S. The Fourth Service Command continued in June to report the lowest rate of admission from colds, influenza, etc. (163 per thousand or about 20 percent lower than the rate for the entire country).

Morbidity from all forms of pneumonia decreased markedly. The admission rate of 8 per thousand for June was about 40 percent lower than for the corresponding month of 1943 and at the lowest level since the summer of 1942. The Sixth Service Command continued to report by far the highest morbidity from this cause; even though the June admission rate for this Service Command was about 25 percent lower than in May, it was almost double the June rate for the country as a whole. The lowest morbidity from pneumonia was reported by the Second and Ninth Service Commands.

MORBIDITY FROM — ALL CAUSES — DISEASE — INJURY — COLDS, INFLUENZA, ETC.

CONTINENTAL UNITED STATES

RESTRICTED

COMMENTS ON RECENT DEVELOPMENTS (CONT'D)

Atypical pneumonia accounted for about two-thirds of the total admissions from pneumonia, the highest proportion so far recorded. The percentage of pneumonia cases diagnosed as atypical was highest in the First and Fourth Service Commands and the Military District of Washington, in all of which the proportion was about 75 percent or more.

DIARRHEA AND DYSENTERY:

Morbidity from diarrhea and dysentery increased by more than 50 percent in June. However, the current level of morbidity is about 35 percent lower than during the corresponding month of 1943. However morbidity from this cause for the first half of 1944 was about the same as during the first 6 months of 1943. The Fourth and Fifth Service Commands reported the highest morbidity from this cause in June 1944.

VENEREAL DISEASE:

Morbidity from venereal disease, excluding cases contracted prior to entry on active service (EPTS), remained at the same high level as during May and was about 20 percent higher than for June 1943. Despite this relatively unfavorable overall experience, morbidity from syphilis has decreased rather steadily during the past two years; the rate of 3.6 per thousand for June 1944 was about 30 percent lower than for the corresponding month of 1943. For the first 6 months of 1944 morbidity from venereal disease, excluding EPTS cases, has been about 20 percent higher than for the first half of 1943.

The First, Second, and Fifth Service Commands reported in June the highest morbidity from venereal disease, excluding EPTS cases; all had rates of at least 40 per thousand. The Second Service Command reported a relatively high admission rate chiefly because of high incidence among task force troops not

under its jurisdiction.

Morbidity represented by venereal EPTS cases was reported at about 15 per thousand during June, a decrease from 20 per thousand in May. Variations in the admission rate for venereal EPTS cases as between Service Commands possess relatively little significance because they reflect a different geographical and racial distribution of Army personnel as compared with that of new inductees.

The very much higher incidence of venereal disease among colored personnel as contrasted with whites is indicated in the chart on page 37. Morbidity from venereal disease, excluding EPTS cases, has throughout this year been about 7 times as high for colored troops as for the remainder of the Army, while for EPTS cases the colored rate was about 30 times as high. Detailed data by race for May 1944 are contained in the Supplementary Health Report of the Weekly Health Report No. 28 (page 33). The June data presented here are preliminary.

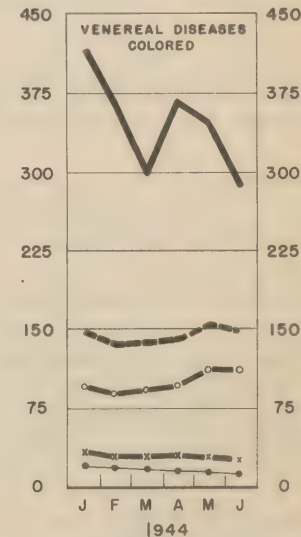

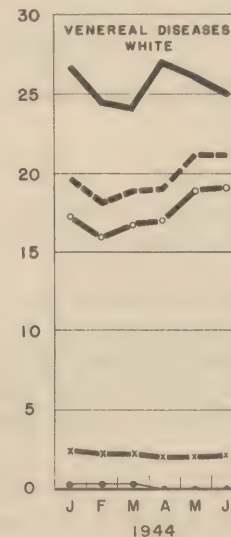

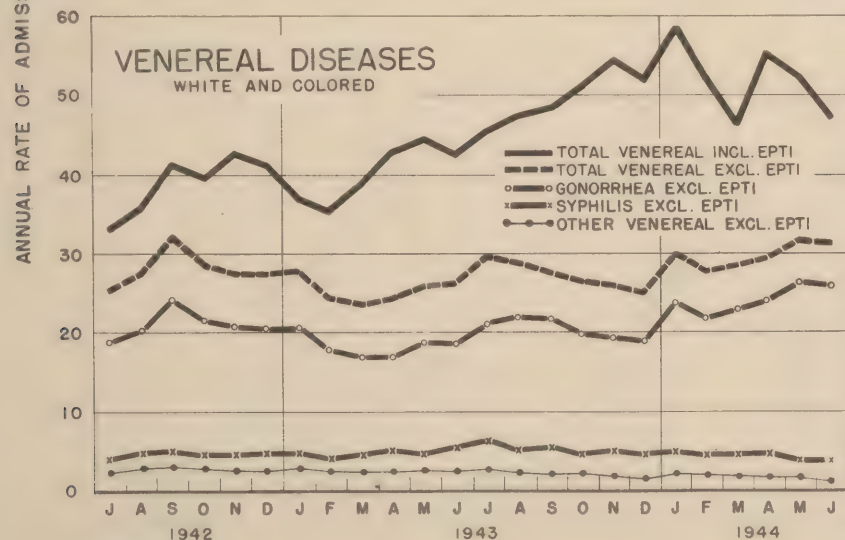

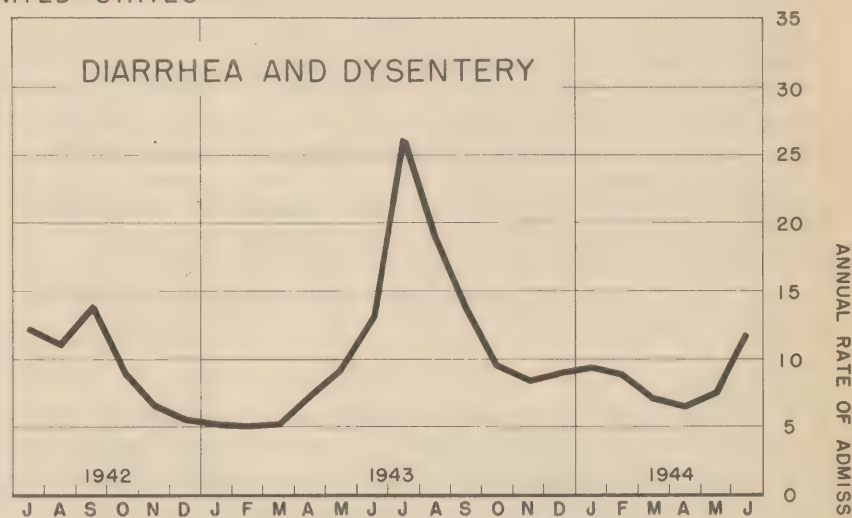

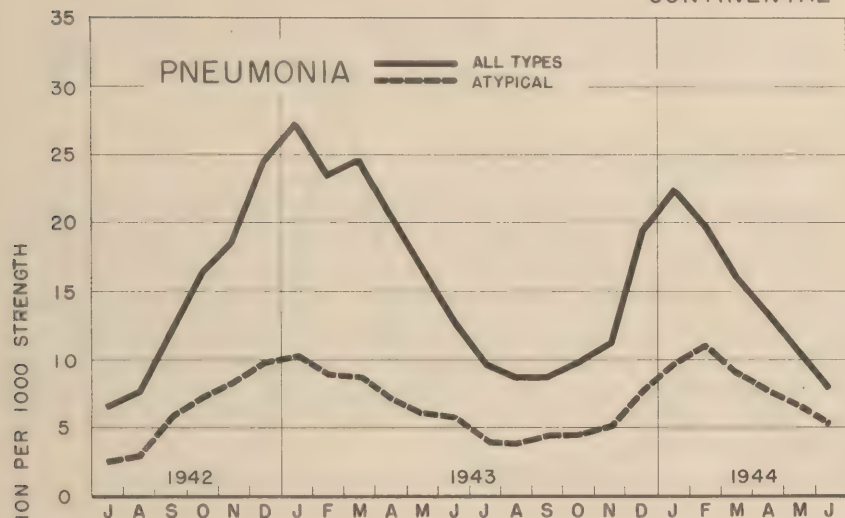

Data on venereal disease cases remaining under treatment at the end of June are shown in the following table.

Service Command	Number Remaining		As Percent of Total Remaining	
	Syphilis	Other	Syphilis	Other
TOTAL U.S.	1250	1974	.87	1.38
I	29	44	.8	1.2
II	65	102	.7	1.1
III	165	205	1.7	2.1

IX	199	303	.9	1.3

MORBIDITY FROM

PNEUMONIA DIARRHEA AND DYSENTERY VENEREAL DISEASES

CONTINENTAL UNITED STATES

RESTRICTED

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

The great bulk of these cases were contracted after entry on active service. Syphilis cases represented .87 percent of the total patients remaining under treatment in hospital, while gonorrhea and other venereal diseases accounted for 1.38 percent of the total patients. The very much longer duration of hospitalization for syphilis is indicated by the fact that less than 12 percent of the total venereal admissions (excluding EPTS cases) were for this cause, but almost 40 percent of the cases remaining under treatment were for syphilis. The total number of days lost from duty during June because of venereal disease was about 116,000 or an average of about 23,000 per week; this represented a non-effective rate of .81 per thousand which was the same as in May.

MEASLES:

Morbidity from measles decreased seasonally to the relatively low rate of 1.6 per thousand which however is probably about 3 times as high as the minimum rate that may be expected during the late summer and fall months. For the first half of 1944 morbidity from this cause was about 65 percent lower than during the corresponding part of 1943. No Service Command reported especially high morbidity from this cause during June.

MUMPS:

Morbidity from mumps decreased by almost 50 percent during June. The admission rate from this cause was several times higher than for measles or scarlet fever. In previous years a longer time also elapsed before the admission rate for mumps declined sharply to reach its seasonal low, generally during the fall months. For the first 6 months of 1944 morbidity from this cause was about 45 percent lower than for the same period of 1943.

SCARLET FEVER:

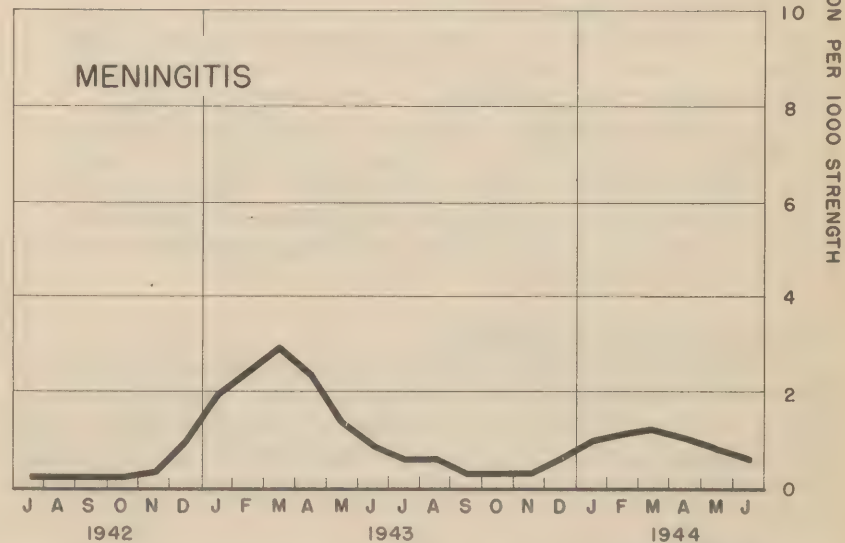

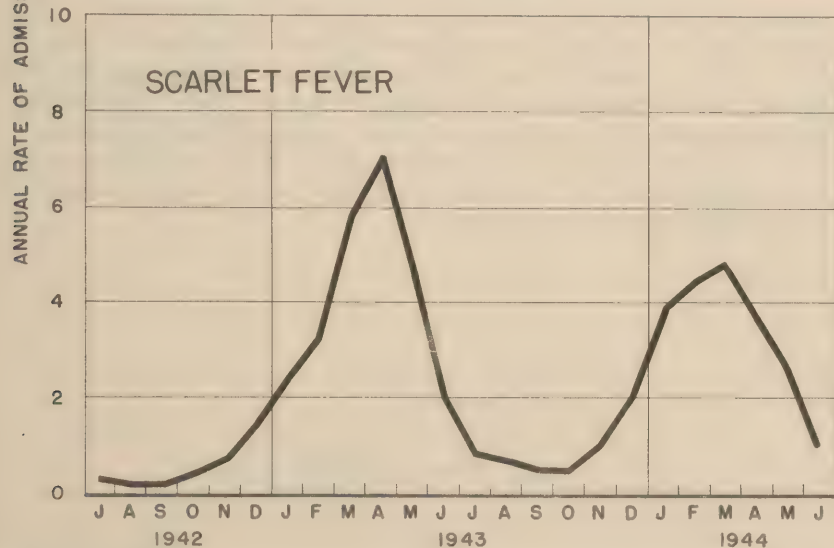

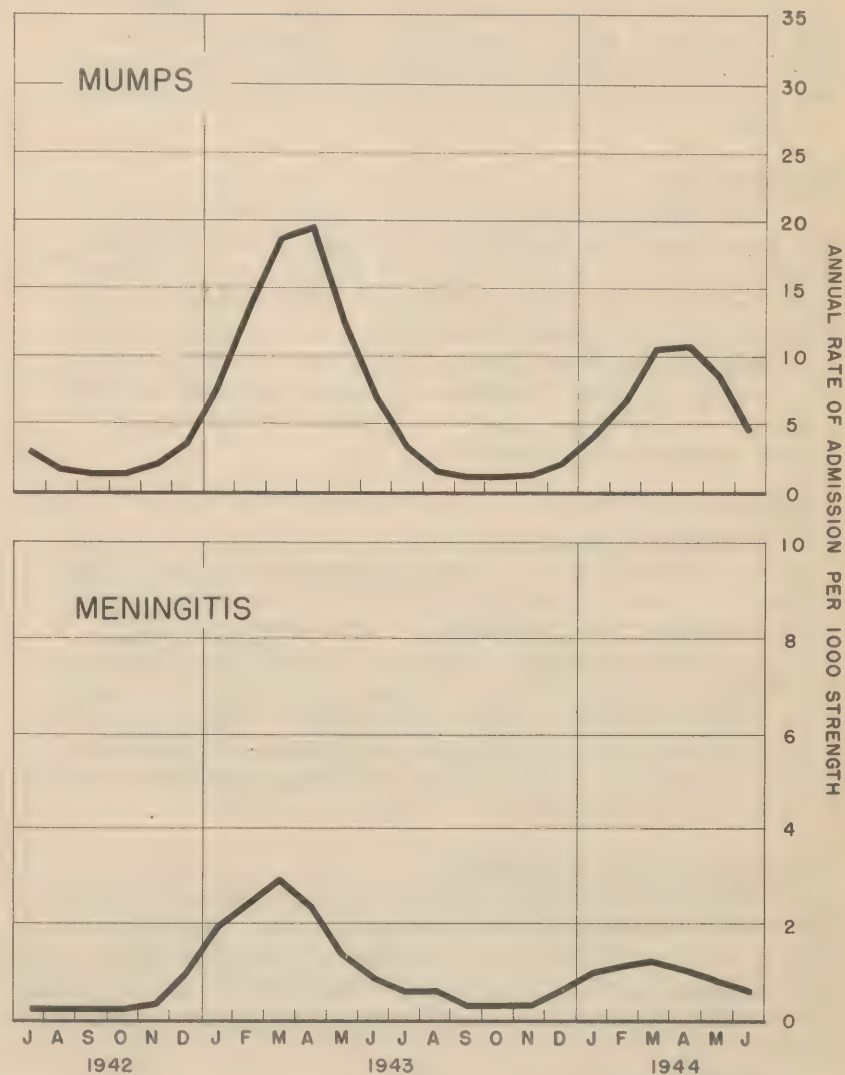

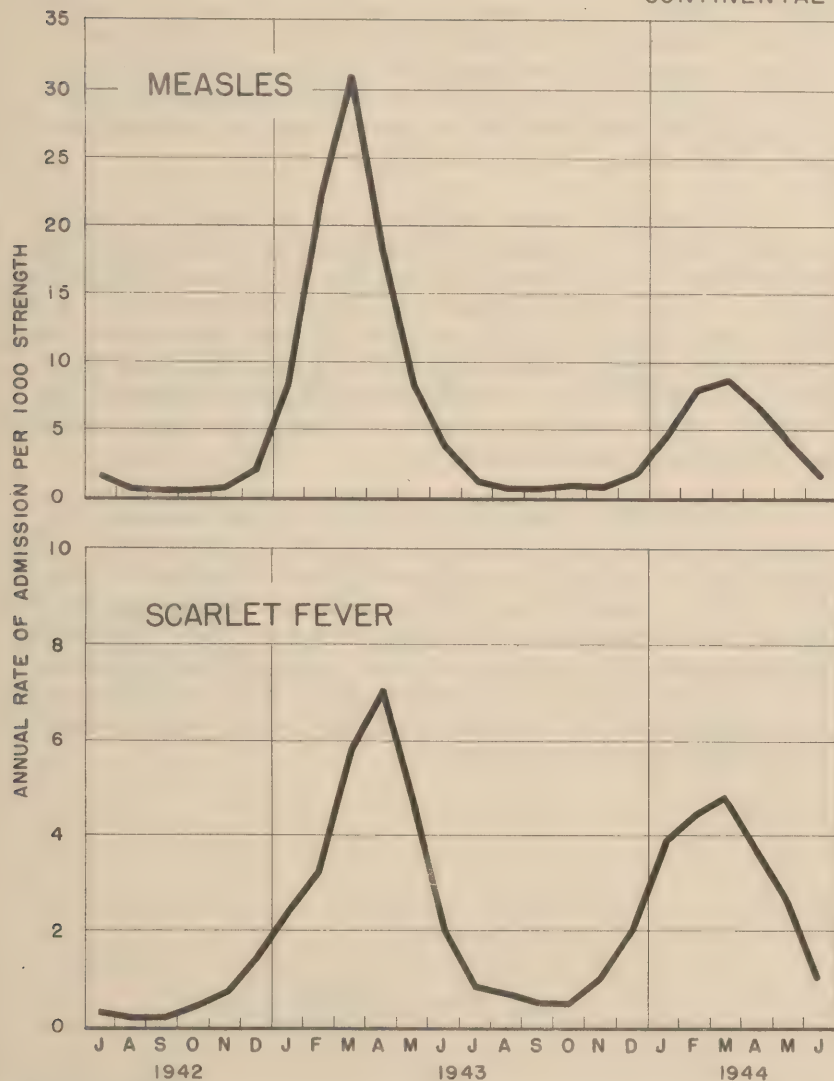

Morbidity from scarlet fever declined sharply in June and was at a rate of only 1.0 per thousand. Nonetheless, further seasonal decreases may be expected in the next few months. Unlike the morbidity experience for measles and mumps the admission rate for scarlet fever for the first 6 months of 1944 was only slightly lower than in the first half of 1943.

MENINGOCOCCIC MENINGITIS:

Morbidity from meningitis decreased for the third consecutive month and was reported at .6 per thousand for June. This is about 30 percent lower than during June 1943 but is considerably above the low level reported during the period from September to November 1943 when the rate was only .3 per thousand. No Service Command reported a relatively high morbidity rate from this cause. The admission rate from meningitis for the first 6 months of 1944 was about 50 percent lower than during the same period of 1943.

MORBIDITY FROM — MEASLES — MUMPS SCARLET FEVER — MENINGITIS

CONTINENTAL UNITED STATES

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

RHEUMATIC FEVER:

Morbidity from rheumatic fever decreased by about 10 percent from the record high level maintained during the previous three months and was at the same level as in June 1943. The admission rate from this cause for the first 6 months of this year was about 35 percent higher than for the first half of 1943.

TUBERCULOSIS:

Morbidity from tuberculosis continued at about the same level as has prevailed during the previous twelve months, but considerably below that in 1942. The admission rate for June was reported at 1.0 per thousand or 10 percent above May. As of the end of June 1944 there were about 1150 cases of tuberculosis remaining under treatment; these represented .80 percent of the total number of patients remaining under treatment in hospital.

MALARIA:

Morbidity from malaria acquired in the U.S. increased seasonally to .3 per thousand in June. The number of cases of malaria presumably acquired overseas admitted for treatment in June averaged about 600 per week or about 25 percent higher than the weekly average in May and by far the highest so far recorded. As of the end of the month there were about 2300 cases of malaria remaining under treatment representing 1.61 percent of the total patients remaining under treatment in hospital.

NEUROPSYCHIATRIC DISORDERS:

The annual rate of admission from neuropsychiatric disorders increased fractionally to 32.7 per thousand, which is the highest rate reported since September 1943. The current level of morbidity from this cause is about 50 percent higher than that during the early months of 1943.

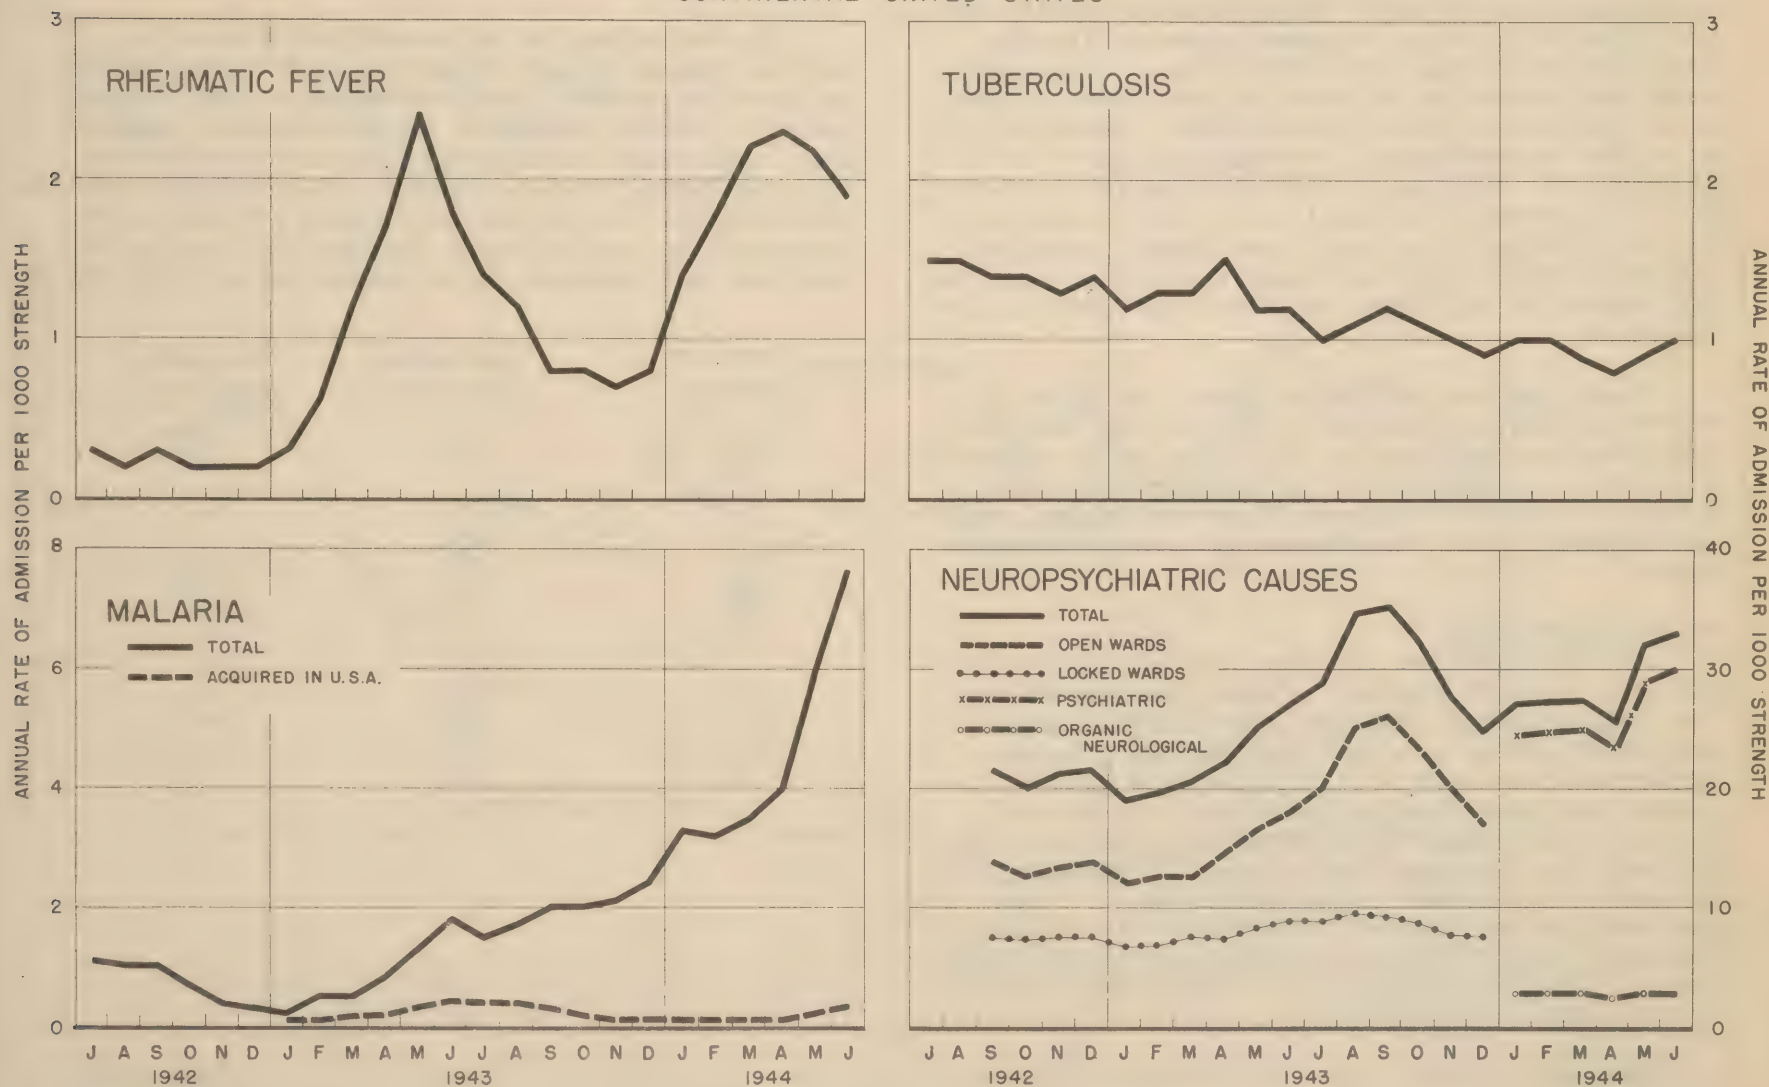

The Second Service Command, which had a very high rate of admission from these causes during May, reported a 20 percent increase in June to a figure of almost 70 per thousand (more than double the rate for the United States as a whole); this increase reflected in part a relatively large number of admissions at Atlantic City AAF Redistribution Center and at several General Hospitals.

Psychiatric cases continued to account for slightly more than 90 percent of the total neuropsychiatric admissions. As in previous months this same proportion held in most Service Commands, with the exception of the First (where less than 1 percent of the cases were reported as organic neurological) and the Military District of Washington and the Sixth Service Command (in both of which over 15 percent of the cases were reported as organic neurological).

The number of neuropsychiatric cases remaining under treatment at the end of the month increased slightly to 16,444, the highest level attained so far this year. Almost the entire increase was accounted for by locked ward cases. Neuropsychiatric cases remaining represented 11.5 percent of the total patients remaining in hospital for all causes, with the open ward cases accounting for 7.8 percent and the locked ward cases for the remaining 3.7 percent.

MORBIDITY FROM — RHEUMATIC FEVER — TUBERCULOSIS MALARIA — NEUROPSYCHIATRIC CAUSES

CONTINENTAL UNITED STATES

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

MORTALITY:

Mortality from all causes during June was reported at a rate of 2.30 per thousand or about 5 percent lower than for May. The reported mortality rate for injury of 1.78 per thousand accounted for the major portion of the total death rate. It should be noted that reporting of deaths on Form 86ab is known to be incomplete, particularly deaths from injury for which the understatement is possibly as great as 25 percent. The decrease in the total death rate was due to decreases in mortality from both disease and injury. The mortality rate from disease, reported at .52 per thousand, was the lowest registered since the fall months of 1943 (when the level was about .45 per thousand).

Mortality from all causes during the first 6 months of 1944 was about 10 percent higher than for the corresponding period of 1943; the entire increase was more than accounted for by the mortality rate from injury which was almost 30 percent higher, while the mortality rate from disease was about 20 percent lower.

NON-EFFECTIVE RATE:

The non-effective rate for June was reported at 36.0 per thousand strength or about the same as for the previous month. Despite lower admission rates the non-effective rate for June 1944 was 9 percent higher than for June 1943; this increase is more apparent than real since it is entirely the result of the inclusion of days lost in General Hospitals by evacuees from overseas (who account for probably 15 percent of the current non-effective rate). When the time lost by evacuees from overseas is excluded, the non-effective rate for personnel stationed in the United States is indicated to be lower than at the corresponding time in 1943.

The non-effective rate from injury in June was

7.4 per thousand strength which is about the same as in previous months.

The variations in the non-effective rate by Service Command do not reflect so much the variations in morbidity between Service Commands as the varying number of General Hospitals in each Service Command. When comparisons are made between the non-effective rates excluding General Hospitals, the variations in the non-effective rate by Service Command are seen to be very much smaller than when the days lost in General Hospitals are included, as evidenced in the table below:

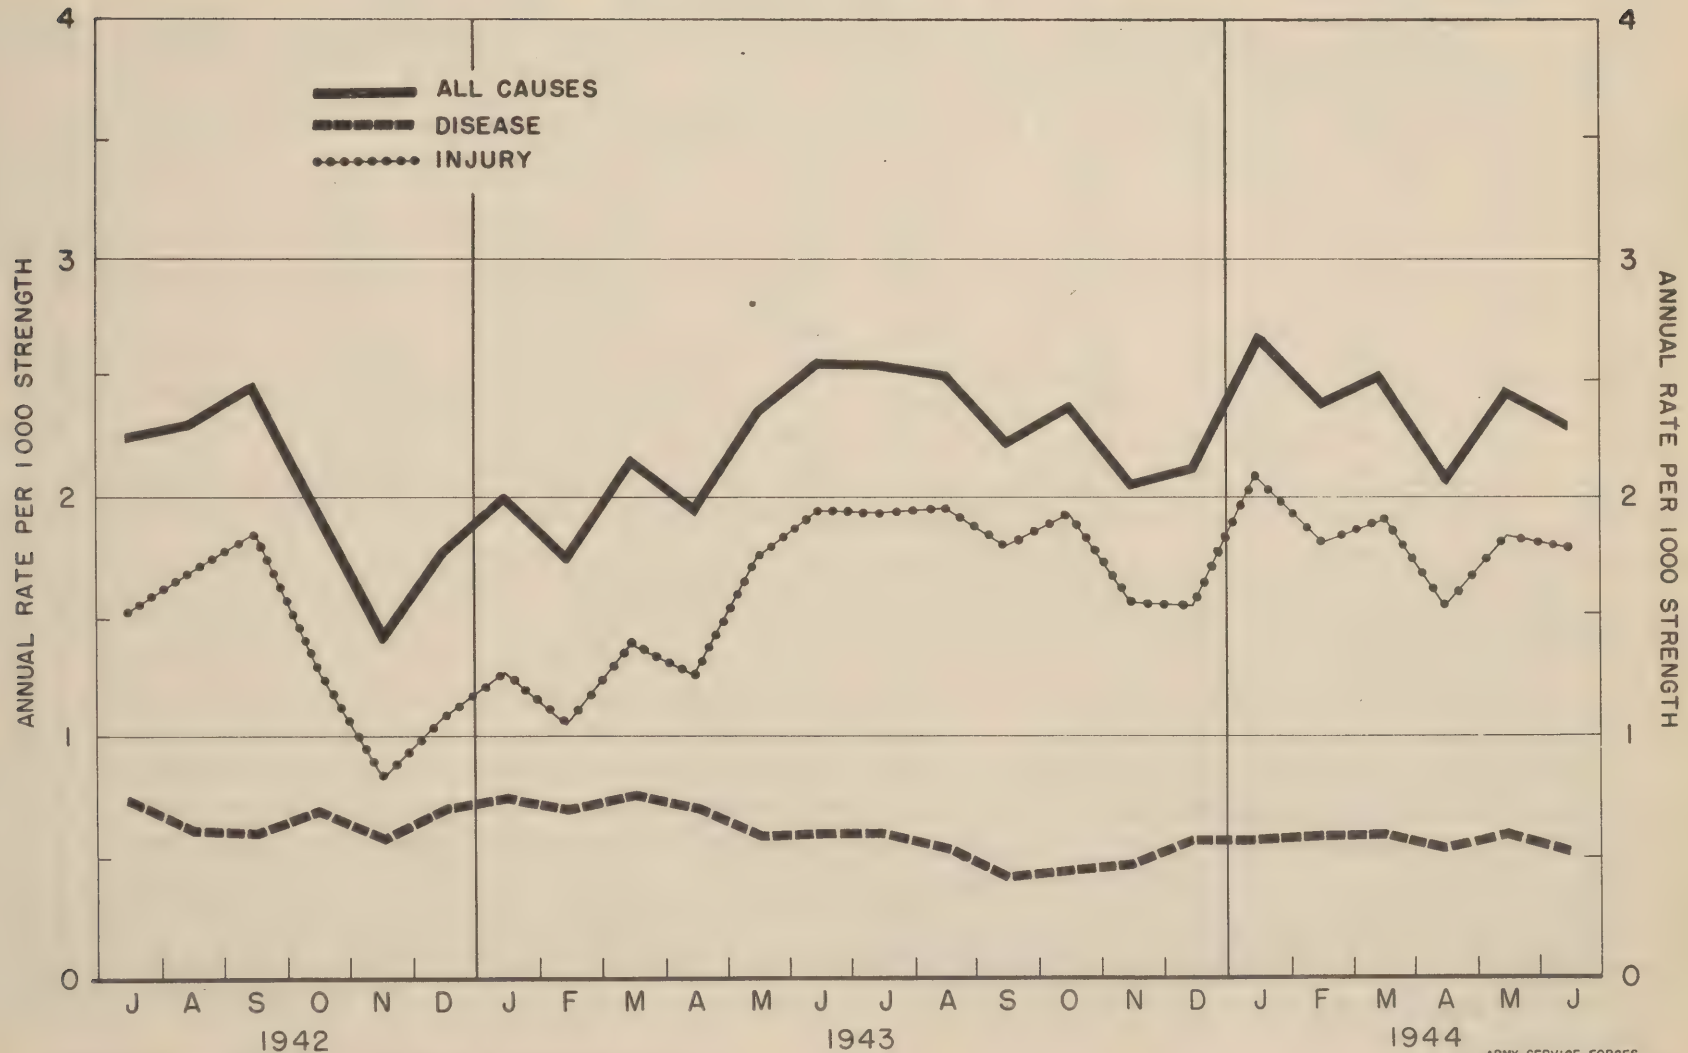

<u>Service Command</u>	<u>Including Gen.Hosp.</u>	<u>Excluding Gen.Hosp.</u>
TOTAL U.S.	36.0	23.0
I	39.2	22.8
II	45.1	20.9
III	36.5	23.2
MDW	75.8	26.5
IV	31.1	23.3
V	50.2	17.9
